

# DermaPlaning

DermaPlaning is a non-invasive treatment used to remove dead skin cells and make your skin look youthful and smooth. This treatment can be used as an alternative to stronger chemical peels and microdermabrasion and does not require any downtime.

The benefits include:

- Collagen production
- Decrease in fine lines & wrinkles
- Prevents acne
- Can serve as a primer for makeup application
- Reduction in pore size
- Treats uneven skin tone
- Clearer complexion
- Helps in absorbing skin products

The procedure involves removing the outer layer of the skin with a medical grade surgical blade in an orderly fashion, which removes the peach fuzz and the dry skin cells on your face. The procedure is followed by a mild Skinbetter Alpharet Micropeel that will accelerate and maximize results and contains Lactic, Salicylic acid, Glycolic acid, and AlphaRet to deliver benefits that improve the appearance of premature skin aging and problem-prone skin.
